                             comprising a region where amino acid residues corresponding to at least a portion of a two complementarity determining regions (CDRs) are replaced with a peptide mimetic selected from an erythropoietin (EPO) mimetic and a thrombopoietin (TPO) mimetic. An immunoslobulin molecule of the invention has immunosuppressive activity, and may have a use in immunotherapy. The immunoglobulin molecule is useful for diagnosing or treating thrombocytopenia as a result of chemotherapy, bone marrow transplantation, or chronic diseases such as idiopathic thrombocytopenia. The present sequence represents a TPO mimetic neartife.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      whose cells are then used for rescue of recipient subject. Also useful in the treatment of thrombocytopenia. (M1) enables transplantation to proceed in patients who would not otherwise be considered as candidates because of unacceptably high risk of falled engraftment, reduces the number of aphereses required to generate a minimum acceptable harvest, reduces the incidence of primary and secondary failure of engraftment by increasing the number of haematopoietic stem cells (HSCs) available for transplantation and reduces the time required for primary engraftment. The present sequence represents an example of TPO mimetic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         delayed primary engraftment, reducing the time of platelet and/or of platelet production and reducing the time of platelet and/or neutrophil engraftment following reinfusion of stem cells from a donce (MI) is also useful for increasing the number of stem cells from a donce the constant subject. Also useful stem cells are then used for rescue of recipient subject. Also useful the constant subject is a constant subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                               New immunoglobulin molecule comprising a region, where two complementarity determining regions (CDRs) are replaced wi or a TPO mimetic, useful for treating thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunoglobulin; complementarity determining region; CDR; peptide
erythropoietin; EPO; thrombopoietin; TPO; immunosuppressive;
immunotherapy; thrombocytopenia.

                                             The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). It is part of a dimer linked by the omega amino acid to the omega amino acid in the sequence in AAWO9468. The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                                                                                                                                     Thrombopoietin receptor-binding/activating peptide(s) and peptide mimetic(s) - useful in treatment of haematological disorders, esp thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10-SEP-1997

                         Query Match
                                                                                                                                                                                                                                            Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                   Sequence 16 AA;
                                                                                      resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate th mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                       The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin
                                                                                                                                                                                                                                                                                                                                                                                           07-JUN-1995;

It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thrombopoietin receptor; binding peptide; treatment; agon; haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis; signal transduction; receptor activation; cell culture.

                                                                                                                                                                                                                                                                                                                                     The invention relates to peptide compounds composed of two peptide chains CC attached to each of the amino groups of a single Lys in the amide form. CC The compounds are of formula (Pepi) (Pep2)K(NHZ), where Pepi is of CC formula: X1-I-E-X2-P-T-L-X3-X4-X5-L-X6-X7-X8-X9-X10; and pep2 is of CC formula: X1-I-E-X2-P-T-L-X3-X4-X5-L-X6-X7-X8-X9-X10; X1 = H or acyl; X2 CC = Gly or Sar (sarcosine); X3 = Arg, Ala, Nle (norleucine) or N-CC acetyllysine; X4 = Gln or Glu; X5 = Try, L-1-naphthylalanine or Phe; X6 = CC Ala, 5-aminopentanoic acid or 2-aminobutyric acid; X7 = Ala, CC diphenylalanine, or is absent; X8 = Arg, p- amino-phenylalanine, N-CC diphenylalanine, or is absent; X9, X9' = Ala, beta Ala, N-methyl-alanine, CC Sar, or is absent; X10' = beta Ala or is absent. The new peptides CC are capable of binding to, and activating, the thrombopoietin (TPO) CC are capable of binding to, and activating, the thrombopoietin (TPO) CC are capable of TPO. They may be used as competitive binders in assays CC to screen for new TPO receptor agonists. They may be used as reagents for detecting TPO receptors in living cells, biological fluids, etc. They may be used to maintain growth and proliferation of TPO-dependent cells and CC por in vitro expansion of megakarycoytes. They may be used to activate TPO receptors in vivo, e.g., to treat blood disorders or thrombocytopaenia associated with bone marrow transfusions, radiotherapy CC or chemotherapy. The present sequence represents an example of CC covalently attached to a hydrophilic polymer (claim 1 except when it is

The invention relates to peptide compounds composed of two peptide chains attached to each of the amino groups of a single Lys in the amide form. CC The compounds are of formula (Pep1) (Pep2)K(NH2), where Pep1 is of CC formula: X1-I-B-X2-P-T-L-X3-X4-X5-L-X6-X7-X8-X9-X10; and pep2 is of CC formula: X1-I-B-X2-P-T-L-X3-X4-X5-L-X6-X7-X8-X9-X10; and pep2 is of CC acetyllysine; X4 = Gln or Gli; X5 = Txp, L1-naphthylalanine or Phe; X6 = CC Ala, 5-aminopentanoic acid or 2-aminobutyric acid; X7 = Ala, N-methyl-alanine, Or is absent; X8 = Arg, p- amino-phenylalanine, N-CC acetyl-lysine, or is absent; X9, x9' = Ala, beta Ala, N-methyl-alanine, CC Sar, or is absent; X10, X10' = beta Ala or is absent. The new peptides CC are capable of binding to, and activating, the thrombopoietin (TP0) CC receptor. They may be used in vitro as tools for understanding the CC biological role of TPO. They may be used as competitive binders in assays to screen for new TPO receptor agonists. They may be used as reagents for detecting TPO receptors in living cells, biological fluids, etc. They may be used to maintain growth and proliferation of TPO-dependent cells and CC por in vitro expansion of megakaryocytes. They may be used to activate thrombocytopaenia associated with bone marrow transfusions, radiotherapy or chemotherapy. The present sequence represents a specific example of CC (Pen1)K(NH2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide compound(s) which can bind and activate thrombopoietin receptor - may be used in treating haematological disorders and in methods for screening for new thrombopoietin receptor agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Modified-site

                                                                                                                                                                                                                                                                                        The invention relates to new peptides which are capable of binding to, and activating, the thrombopoietin (TPO) receptor. They may be used in vitro as tools for understanding the biological role of TPO. They may be used as competitive binders in assays to screen for new TPO receptor agonists. They may be used as reagents for detecting TPO receptors in living cells, biological fluids, etc. They may be used to maintain growth and proliferation of TPO-dependent cells and for in vitro expansion of megakaryocytes. They may be used to activate TPO receptors in vivo, e.g., to treat blood disorders or thromborytopaenia associated with bone marrow transfusions, radiotherapy or chemotherapy. The present sequence this board disorders as specific example of a peptide chain of a branched peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide compound(s) which can bind and activate thrombopoietin receptor - may be used in treating haematological disorders and in methods for screening for new thrombopoietin receptor agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           thrombopoietin receptor; haematological disorder; screening; agonist; assay; megakaryocyte; blood disorder; thrombocytopaenia; TPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dower WJ, Barrett

AC C
         The invention relates to peptide compounds composed of two peptide chains cattached to each of the amino groups of a single Lys in the amide form. CC The compounds are of formula (Pepl) (Pep2) K(NH2), where Pepl is of CC formula: X1-1-E-X2-P-T-L-X3-X4-X5-L-X6-X7-X8-X9-X10; and pep2 is of CC endla: X1-1-E-X2-P-T-L-X3-X4-X5-L-X6-X7-X8-X9-X10; and pep2 is of CC endly or Sar (sarcosine); X3 = Arg, Ala, Nle (norleucine) or N-CC acetyllysine; X4 = Gln or Glu; X5 = Trp, L-1-naphthylalanine or Phe; X6 = CC Ala, 5-aminopentanoic acid or 2-aminobutyric acid; X7 = Ala, N-actyllysine, or is absent; X8 = Arg, p-amino-phenylalanine, N-CC diphenylalanine, or is absent; X9, X9' = Ala, beta Ala, N-methyl-alanine, CC Sar, or is absent; X10, X10' = beta Ala or is absent. The new peptides CC are capable of binding to, and activating, the thrombopoietin (TPO) CC receptor. They may be used in vitro as tools for understanding the biological role of TPO. They may be used as competitive binders in assays to screen for new TPO receptor agonists. They may be used as reagents for detecting TPO receptors in living cells, biological fluids, etc. They may be used to maintain growth and proliferation of TPO-dependent cells and CC be used to maintain growth and proliferation of TPO-dependent cells and CC thrombocytopaenia associated with bone marrow transfusions, radiotherapy correspond transfusions, radiotherapy correspond transfusions, radiotherapy correspond to activate or thrombocytopaenia associated with bone marrow transfusions, radiotherapy correspond to activate or the present semisors represents a meerific example of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide compound(s) which can bind and activate thrombopoietin receptor - may be used in treating haematological disorders and in methods for screening for new thrombopoietin receptor agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               thrombopoietin receptor; haematological disorder; screening; assay; megakaryocyte; blood disorder; thrombocytopaenia; TPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SXS
Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that contact and activate the human thrombopoietin receptor (PPO-R). Methods of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological materials. They may also be used for in situ staining, fluorescence-activated cell sorting, Western blotting and cenzyme-linked immunosorbent assay (ELISA). In addition, the peptides can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Best Loc

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

C;Comment: The enzymatic steps in the condensation of L-serine and 2,3-dihydroxybenzoic ty is based on its recognized homology with 4-coumarate-CoA ligase and by analogy with tC;Comment: The formation of 2,3-dihydroxybenzoyl-AMP has been observed. The rapid reacticarrier protein) to release AMP, has also been observed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A;Accession: A48308

       . Gen. Genet. 225:320-330(1991).

FUNCTION: Transcriptional activator for the cbb operon (cbbis for RuBisCO and other Calvin cycle genes. Binds specifically two binding sites in the cbbr-cbbi intergenic region.

SIMILARITY: Contains 1 HTH lysr-type DNA-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 286
